

# Rcpp Quick Reference Guide

Dirk Eddelbuettel<sup>a</sup> and Romain François<sup>b</sup>

<sup>a</sup><http://dirk.eddelbuettel.com/>; <sup>b</sup><https://romain.rbind.io/>

This version was compiled on July 3, 2021

This document provides short code snippets that are helpful for using the Rcpp (Eddelbuettel *et al.*, 2021; Eddelbuettel and François, 2011; Eddelbuettel, 2013).

Rcpp | quickref | R | C++

## Important Notes

```
// If you experience compiler errors, please check  
// that you have an appropriate version of g++.  
// See 'Rcpp-FAQ' for more information.
```

```
// Many of the examples here imply the following:  
#include <Rcpp.h>  
using namespace Rcpp;  
// The cppFunction will automatically add this.
```

```
// Or, prefix Rcpp objects with the Rcpp namespace  
// as e.g. in:  
Rcpp::NumericVector xx(10);
```

## Create simple vectors

```
SEXP x; std::vector<double> y(10);  
  
// from SEXP  
NumericVector xx(x);  
  
// of a given size (filled with 0)  
NumericVector xx(10);  
// ... with a default for all values  
NumericVector xx(10, 2.0);  
  
// range constructor  
NumericVector xx(y.begin(), y.end());  
  
// using create  
NumericVector xx =  
    NumericVector::create(1.0, 2.0, 3.0, 4.0);  
NumericVector yy =  
    NumericVector::create(Named("foo") = 1.0,  
                          _["bar"] = 2.0);  
// _ short for Named
```

## Extract and set single elements

```
// extract single values  
double x0 = xx[0];  
double x1 = xx(1);  
  
double y0 = yy["foo"];  
double y1 = yy["bar"];
```

```
// set single values  
xx[0] = 2.1;  
xx(1) = 4.2;  
  
yy["foo"] = 3.0;  
  
// grow the vector  
yy["foobar"] = 10.0;
```

## Using matrices

```
// Initializing from SEXP,  
// dimensions handled automatically  
SEXP x;  
NumericMatrix xx(x);  
  
// Matrix of 4 rows & 5 columns (filled with 0)  
NumericMatrix xx(4, 5);  
  
// Fill with value  
int xsize = xx.nrow() * xx.ncol();  
for (int i = 0; i < xsize; i++) {  
    xx[i] = 7;  
}  
  
// Same as above, using STL fill  
std::fill(xx.begin(), xx.end(), 8);  
  
// Assign this value to single element  
// (1st row, 2nd col)  
xx(0,1) = 4;  
  
// Reference the second column  
// Changes propagate to xx (same applies for Row)  
NumericMatrix::Column zzcol = xx(_, 1);  
zzcol = zzcol * 2;  
  
// Copy the second column into new object  
NumericVector zz1 = xx(_, 1);  
// Copy submatrix (top left 3x3) into new object  
NumericMatrix zz2 = xx( Range(0,2), Range(0,2));
```

## Inline C++ Compile in R

```
## Note - this is R code.  
## cppFunction in Rcpp allows rapid testing.  
require(Rcpp)  
  
cppFunction("  
NumericVector exfun(NumericVector x, int i){  
    x = x*i;  
    return x;  
}")
```

```
exfun(1:5, 3)

## Use evalCpp to evaluate C++ expressions
evalCpp("std::numeric_limits<double>::max()")
```

## Interface with R

### First step in R.

```
# In R, create a package shell. For details,
# see the "Writing R Extensions" manual and
# the "Rcpp-package" vignette.

Rcpp.package.skeleton("myPackage")

# Add R code to pkg R/ directory. Call C++
# function. Do type-checking in R.

myfunR <- function(Rx, Ry) {
  ret = .Call("myCfun", Rx, Ry,
              package="myPackage")
  return(ret)
}
```

### Additional C++.

```
// Add C++ code to pkg src/ directory.
using namespace Rcpp;
// Define function as extern with RcppExport
RcppExport SEXP myCfun( SEXP x, SEXP y) {
  // If R/C++ types match, use pointer to x.
  // Pointer is faster, but changes to xx
  // propagate to R ( xx -> x == Rx).
  NumericVector xx(x);

  // clone is slower and uses extra memory.
  // Safe. No side effects.
  NumericVector yy(clone(y));

  xx[0] = yy[0] = -1.5;
  int zz = xx[0];

  // use wrap() to return non-SEXP objects, e.g:
  // return(wrap(zz));
  // Build and return a list
  List ret;
  ret["x"] = xx;
  ret["y"] = yy;
  return(ret);
}
```

### On the command-line.

```
# From shell, above package directory
R CMD build myPackage
R CMD check myPackage_1.0.tar.gz ## Optional
R CMD INSTALL myPackage_1.0.tar.gz
```

### Back in R.

```
require(myPackage)

aa <- 1.5
bb <- 1.5
cc <- myfunR(aa, bb)
aa == bb
# FALSE, C++ modifies aa

aa <- 1:2
bb <- 1:2
cc <- myfunR(aa, bb)
identical(aa, bb)
# TRUE, R/C++ types don't match
# so a copy was made
```

## STL interface

```
// sum a vector from beginning to end
double s = std::accumulate(x.begin(),
                           x.end(), 0.0);

// prod of elements from beginning to end
int p = std::accumulate(vec.begin(),
                        vec.end(), 1,
                        std::multiplies<int>());

// inner_product to compute sum of squares
double s2 = std::inner_product(res.begin(),
                               res.end(),
                               res.begin(), 0.0);
```

## Rcpp Attributes

### In C++.

```
// Add code below into C++ file Rcpp_example.cpp

#include <Rcpp.h>
using namespace Rcpp;

// Place the 'Rcpp::export' tag
// right above function declaration.

// [[Rcpp::export]]
double muRcpp(NumericVector x){
  int n = x.size(); // Size of vector
  double sum = 0;   // Sum value

  // For loop, note cpp index shift to 0
  for(int i = 0; i < n; i++){
    // Shorthand for sum = sum + x[i]
    sum += x[i];
  }

  return sum/n; // Obtain and return the Mean
}

// Place dependent functions above call or
// declare the function definition with:
double muRcpp(NumericVector x);

// [[Rcpp::export]]
```

```
double varRcpp(NumericVector x, bool bias = true){
  // Calculate the mean using C++ function
  double mean = muRcpp(x);
  double sum = 0;
  int n = x.size();

  for(int i = 0; i < n; i++){
    sum += pow(x[i] - mean, 2.0); // Square
  }

  return sum/(n-bias); // Return variance
}
```

#### In R:

```
Rcpp::sourceCpp("path/to/file/Rcpp_example.cpp")
x <- 1:5
all.equal(muRcpp(x), mean(x))
all.equal(var(x), varRcpp(x))
```

### Rcpp Extensions

```
// Enable C++11
// [[Rcpp::plugins(cpp11)]]

// Enable OpenMP (excludes macOS)
// [[Rcpp::plugins(openmp)]]

// Use the RcppArmadillo package
// Requires different header file from Rcpp.h
#include <RcppArmadillo.h>
// [[Rcpp::depends(RcppArmadillo)]]
```

### Rcpp sugar

```
NumericVector x =
  NumericVector::create(-2.0,-1.0,0.0,1.0,2.0);
IntegerVector y =
  IntegerVector::create(-2, -1, 0, 1, 2);

NumericVector xx = abs( x );
IntegerVector yy = abs( y );

bool b = all( x < 3.0 ).is_true() ;
bool b = any( y > 2 ).is_true();

NumericVector xx = ceil( x );
NumericVector xx = ceiling( x );
NumericVector yy = floor( y );
NumericVector yy = floor( y );

NumericVector xx = exp( x );
NumericVector yy = exp( y );

NumericVector xx = head( x, 2 );
IntegerVector yy = head( y, 2 );

IntegerVector xx = seq_len( 10 );
IntegerVector yy = seq_along( y );
```

```
NumericVector xx = rep( x, 3 );
NumericVector xx = rep_len( x, 10 );
NumericVector xx = rep_each( x, 3 );

IntegerVector yy = rev( y );
```

### Random Number Generation functions

```
// Set seed
RNGScope scope;

// For details see Section 6.7.1--Distribution
// functions of the 'Writing R Extensions' manual.
// In some cases (e.g. rnorm), dist-specific
// arguments can be omitted; when in doubt,
// specify all dist-specific arguments. The use
// of doubles rather than integers for dist-
// specific arguments is recommended. Unless
// explicitly specified, log=FALSE.

// Equivalent to R calls
NumericVector xx = runif(20);
NumericVector xx1 = rnorm(20);
NumericVector xx1 = rnorm(20, 0);
NumericVector xx1 = rnorm(20, 0, 1);

// Example vector of quantiles
NumericVector quants(5);
for (int i = 0; i < 5; i++) {
  quants[i] = (i-2);
}

// in R, dnorm(-2:2)
NumericVector yy = dnorm(quants) ;
NumericVector yy = dnorm(quants, 0.0, 1.0) ;

// in R, dnorm(-2:2, mean=2, log=TRUE)
NumericVector yy = dnorm(quants, 2.0, true) ;

// Note - cannot specify sd without mean
// in R, dnorm(-2:2, mean=0, sd=2, log=TRUE)
NumericVector yy = dnorm(quants, 0.0, 2.0, true) ;

// To get original R api, use Rf_*
double zz = Rf_rnorm(0, 2);
```

### Environment

```
// Special environments
Environment::Rcpp_namespace();
Environment::base_env();
Environment::base_namespace();
Environment::global_env();
Environment::empty_env();

// Obtain an R environment
Environment stats("package:stats");
Environment env( 2 ); // by position
Environment glob = Environment::global_env();
```

```
// Extract function from specific environment
Function rnorm = stats["rnorm"];

// Assign into the environment
glob["x"] = "foo";
glob["y"] = 3;

// Retrieve information from environment
std::string x = glob["x"];
glob.assign( "foo" , 3 );
int foo = glob.get( "foo" );
int foo = glob.find( "foo" );
CharacterVector names = glob.ls(TRUE)
bool b = glob.exists( "foo" );
glob.remove( "foo" );

// Administration
glob.lockBinding("foo");
glob.unlockBinding("foo");
bool b = glob.bindingIsLocked("foo");
bool b = glob.bindingIsActive("foo");

// Retrieve related environments
Environment e = stats.parent();
Environment e = glob.new_child();
```

## Calling Functions in R

```
// Do NOT expect to have a performance gain
// when calling R functions from R!

// Retrieve functions from default loaded env.
Function rnorm("rnorm");
rnorm(100, _["mean"] = 10.2, _["sd"] = 3.2 );

// Passing in an R function and obtaining results
// Make sure function conforms with return type!
NumericVector callFunction(NumericVector x,
                           Function f) {
    NumericVector res = f(x);
    return res;
}

/** R
# The following is R code executed
# by sourceCpp() as a convenience.
x = 1:5
callFunction(x, sum)
*/
```

## Modules

```
// Warning -- Module-based objects do not persist
// across quit(save="yes")/reload cycles. To be
// safe, save results to R objects and remove
// module objects before exiting R.

// To create a module-containing package from R:
// Rcpp.package.skeleton("mypackage", module=TRUE)
```

```
class Bar {
public:
    Bar(double x_) : x(x_), nread(0), nwrite(0) {}

    double get_x( ) {
        nread++;
        return x;
    }

    void set_x( double x_ ) {
        nwrite++;
        x = x_;
    }

    IntegerVector stats() const {
        return
            IntegerVector::create(_["read"] = nread,
                                   _["write"] = nwrite);
    }
private:
    double x; int nread, nwrite;
};

RCPP_MODULE(mod_bar) {
    class_<Bar>( "Bar" )
        .constructor<double>()
        .property( "x", &Bar::get_x, &Bar::set_x,
                  "Docstring for x" )
        .method( "stats", &Bar::stats,
                  "Docstring for stats" )
    ;}

/** R
## The following is R code.
require(mypackage) s
how(Bar)
b <- new(Bar, 10)
b$x <- 10
b_persist <- list(stats=b$stats(), x=b$x)
rm(b)
*/
```
